What happened?

Did you deliver? What did you deliver? What part did you fail to accomplish? Did you build out the features? What features did you successfully build?

UI - Completed all of the MVP features plus the stretch. Landing page was incorporated into the application. New framework was incorporated.

FE - MVP features were completed: Login, register, add/edit habits, complete habits, edit/delete user account, calculate lifeGPA.

BE - MVP features were completed. All of the endpoints that we needed for the front end were implemented. A database to store habit and user info was created.

What did we learn?
- Consistent testing for endpoints is important.
- Time management / time estimation is difficult when learning new things.
- How to properly incorporate/import javascript in HTML files.
- Planning out the project would be beneficial.
- Communication is KEY

What did we do well?
- Communication
- Everyone hit MVP
- Everyone was willing to help
- People pushed beyond their comfort zones.

What should we have done better?

This should not be blame. It should not be "so and so should have". This is an opportunity to describe what the team can improve. Same pattern as "What did we do well?". Let people submit ideas in a thread or Slack message. Add them to a document.
- DL - I wish I had more time to code
- More time to plan out how to execute application.

Next Steps

What concrete actions could the team take to improve on areas we could have done better, and continue to do well in other areas?
- Match up color schemes.
- Keep communicating.
- Set up more video chats.
- Get started right away so that you have more time to plan and less pressure.
